

## Use and Limitations of Floodplain Maps

- Users must note the degree of base map data and photography that supports and issue of mapping relevant to their development in the map. Subsequent developments or changes within the floodplain, of channel (natural or constructed) with effect flood levels and render site-specific map information obsolete.
- Floodplain maps are administrative tools which depict minimum flood elevations and floodplain boundaries. Floodings may occur outside of the designated floodplain boundary.
- Floodplain maps do not provide information on site-specific flood hazards such as, land subsidence, slope, water velocity, sudden shifts in the channel of the watercourse, or alluvium and debris that fill the channel.
- Other sources of water, such as gravity or other barriers can restrict water flow and cause local third level flooding, such as obstructions that prevent debris, flooding in surrounding areas, local ponding, groundwater, or other phenomena that cause flood levels to exceed those indicated on the map. Land outside of a floodplain may be subject to flooding from tributary watercourses.
- Floodplains do not indicate of legal survey boundaries. A site survey is required to reconfirm property location, ground elevations, and designated flood level information.
- The accuracy of the location of a floodplain boundary as shown on this map is limited by the base topography. It is generally assumed to be plus or minus one-half the increment of the ground contours.
- Professional assistance and detailed engineering analysis are required to address any of the above considerations.

## NOTES

Produced by:	Northwest Hydraulic Consultants Ltd. 444 Brookbanks Avenue North Vancouver, B.C.
Survey:	River surveys done by Surveys Section Water Management Branch, Project 86-PDC-3
	a) Horizontal control based on provincial network. b) Elevations are in metres and are referred to Geodetic Survey of Canada datum, (G indicates Survey Monument).
Mapping:	Base mapping done by Map Production Division, Surveys and Resource Mapping Branch, Project 85-0204-C
	a) Contour interval 1 metre and greater; spot elevations shown to 0.1 metres, with accuracy to 0.3 metres, except where noted. b) Grid origin referred to U.T.M. Rectification

## FLOODPLAIN DATA

1. The floodplain areas as depicted on this map have been designated pursuant to the Canada/British Columbia Floodplain Mapping Agreement (1998) by the Minister of the Environment for Canada and the Minister of Environment for British Columbia.
2. Flooding may still occur outside of the designated floodplain areas. The Ministers do not assume any liability by reason of the designation or failure to designate areas on this map.
3. The Designated Flood has a statistical frequency of occurrence of once every 200 years.
4. The flood levels were computed using a standard step method modelling technique, assuming open water flow conditions.
5. The floodplain limits assume the absence of all dykes.
6. The floodplain limits and flood levels include an allowance for freeboard.
7. The floodplain limits are not established on the ground by legal survey.
8. The floodplain limits are not delineated for side streams and tributaries.
9. The required setback of buildings from the natural boundaries of lakes and watercourses to allow for the passage of floodwaters and possible bank erosion is not shown. This information is available either through local municipalities or the Minister of Environment.
9. MAPS AVAILABLE FROM THE MINISTRY OF CROWN LANDS, SURVEYS AND RESOURCE MAPPING BRANCH, MAPS B.C., MAP AND AIR PHOTO SALES, VICTORIA, B.C.
